Section 1 – Fundamentals

1-1 Introduction to PL/SQL

Procedural Constructs	Programming language features such as reusable/callable program units, modular blocks, cursors, constants, variables, assignment statements, conditional control statements, and loops.	
PL/SQL	Oracle Corporations standard procedural language for relational databases which allows basic program logic and control flow to be combined with SQL statements.	

MySQL	ORACLE
set @prom = (select avg(salary) from employees);	define prom = (select avg(salary) from employees);
select avg(salary) into @prom from employees;	select &prom promedio from dual;
select @prom from dual;	
set @stmt = 'SELECT employee_id, salary FROM employees';	DEFINE colname=salary ;
execute IMMEDIATE @stmt;	SELECT employee_id, &colname FROM employees;

Procedural Language extension to SQL.

```
-- anonymous procedures
set serveroutput on
declare
prom number;
begin
select avg(salary) into prom from employees;
dbms_output.put_line('promedio: ' || prom);
end;
/
```

```
set serveroutput on;
                                               CREATE OR REPLACE PROCEDURE tabla(numero NUMBER)
declare
  numero number := 5;
                                               cadena VARCHAR2(100);
  cadena varchar2(100);
                                               BEGIN
begin
                                                  FOR i IN reverse 1..10 LOOP
                                                     cadena := numero ||
  for i in 1..10 loop
                                                        'x'||i||'='|| (numero*i);
   cadena := numero ||
      'x'||i|| ''='|| (numero*i);
                                                     dbms_output.put_line(cadena);
   dbms output.put line(cadena);
                                                  END LOOP;
                                               END;
  end loop;
end;
```

```
CREATE OR REPLACE FUNCTION factorial(m number)
                                                  DECLARE
  RETURN number
                                                    CURSOR cursor employees IS
IS
                                                      SELECT * FROM employees

    END LOOP;
END;
```

1-2 Benefits of PL/SQL

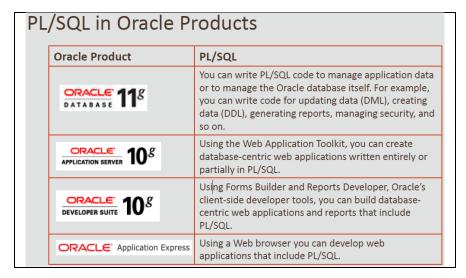

Portability	The ability for PL/SQL programs to run anywhere an Oracle server runs.		
Blocks	The basic unit of PL/SQL programs - also known as modules.		
Exceptions	Exceptions An error that occurs in the database or in a user's program during runtime.		

You can nest blocks inside other blocks to build powerful programs.

PL/SQL is integrated in Oracle tools, such as Oracle Forms Developer, Oracle Report Builder, and Application Express. You can write portable program packages and create libraries that can be reused in different environments. Exception Handling:

- If no data is found then...
 - If too many rows are found then...
 - If an invalid number is calculated then...

PL SQL 1/2 Página **4** de **24**

1-3 Creating PL/SQL Blocks

Anonymous PL/SQL	Unnamed blocks of code not stored in the database and do not exist after they are		
block	executed		
Function	A program that computes and returns a single value		
Subprograms	Named PL/SQL blocks that are stored in the database and can be declared as procedures or functions		
Compiler	Software that checks and translates programs written in high-level programming languages into binary code to execute		
Procedure	A program that performs an action, but does not have to return a value		

Application Express	Browser-based, database-driven, application development environment.		
SQL Workshop	A component of Application Express.		
Application Builder	A component of Application Express.		
SQL Developer	An IDE for database development and management.		
JDeveloper	An IDE for Java-based development.		
NetBeans	An IDE for Java, HTML5, PHP, and C++.		

Anonymous Blocks	Procedure: Performs an action	Function: Computes and returns a value
[DECLARE]	PROCEDURE name	FUNCTION name
BEGIN	IS	RETURN datatype
statements	variable declarations	variable declaration(s)
[EXCEPTION]	BEGIN	IS
END;	statements	BEGIN
	[EXCEPTION]	statements
	END;	RETURN value;
		[EXCEPTION]
		END;

Section	Description	Inclusion
Declarative (DECLARE)	Contains declarations of all variables, constants, cursors, and user-defined exceptions that are referenced in the executable and exception sections.	Optional
Executable (BEGIN END;)	Contains SQL statements to retrieve data from the database and PL/SQL statements to manipulate data in the block. Must contain at least one statement.	Mandatory
Exception (EXCEPTION)	Specifies the actions to perform when errors and abnormal conditions arise in the executable section.	Optional

PL SQL 1/2 Página **5** de **24**

```
EXCEPTIONS
set SERVEROUTPUT ON;
DECLARE
    v first name VARCHAR2(25);
    v last name VARCHAR2(25);
BEGIN
    SELECT first_name, last_name
    INTO v_first_name, v_last_name
    FROM employees
    WHERE last name= 'King';
    DBMS_OUTPUT.PUT_LINE ('The employee of the month is: ' ||
                          v first name|| ' ' || v last name|| '.');
EXCEPTION
    WHEN TOO MANY ROWS THEN
        DBMS_OUTPUT.PUT_LINE ('Your select statement retrieved multiple rows.
                            Consider using a cursor or changingthe search criteria.');
END;
```

```
CREATE OR REPLACE PROCEDURE print_date
IS
v_date VARCHAR2(30);
BEGIN
SELECT TO_CHAR(SYSDATE,'Mon DD, YYYY') INTO v_date FROM DUAL;
DBMS_OUTPUT.PUT_LINE(v_date);
END;
begin
PRINT_DATE;
end;
/
call print_date();
execute print_date();
```

```
CREATE OR REPLACE FUNCTION tomorrow(p_today IN DATE)

RETURN DATE

IS

v_tomorrow DATE;

BEGIN

SELECT p_today+1 INTO v_tomorrow FROM DUAL;

RETURN v_tomorrow;

END;

BEGIN

SELECT TOMORROW(SYSDATE);

SELECT TOMORROW(SYSDATE) FROM DUAL;
```

```
CREATE OR REPLACE FUNCTION factorial(m number)
                                                     set SERVEROUTPUT ON
  RETURN number
                                                    BEGIN
IS
                                                    DBMS_OUTPUT.PUT_LINE(factorial(5));
  r number default 1;
                                                    END;
  n number := m;
BEGIN
   while (n > 0) loop
                                                    select factorial(5) from dual;
      r := r * n;
      n := n - 1;
   end loop;
   return r;
END;
```

PL SQL 1/2 Página **6** de **24**

Section 2 – Defining Variables and Datatypes

2-1 Using Variables in PL/SQL

Variables	Used for storage of data and manipulation of stored values.		
Parameters	Values passed to a program by a user or by another program to customize the program.		

Identifier [CONSTANT] datatype [NOT NULL] [:= expr| DEFAULT expr];

```
set SERVEROUTPUT ON
DECLARE
/* Declaracion de
    Variables */
    v_counter INTEGER := 0;
    v_contador number(3) DEFAULT 0;
    v_name VARCHAR2(20) := 'John';
    v_date Date default SYSDATE;
    c_pi constant number(5,4) := 3.1416;
    v_activo BOOLEAN := True;
BEGIN
    v_counter:= v_counter + 1;
    -- SELECT SYSDATE INTO v_date FROM DUAL;
    DBMS_OUTPUT.PUT_LINE(v_counter || ' ' || v_name || ' ' || v_date);
END;
//
```

2-2 Recognizing PL/SQL Lexical Units

Literals	An explicit numeric, character string, date, or Boolean value that is not represented		
	by an identifier. 'UPA' != 'Upa'		
Delimiters	Symbols that have special meaning to an Oracle database.		
Reserved words	Words that have special meaning to an Oracle database and cannot be used as		
	identifiers.		
Comments	Describe the purpose and use of each code segment and are ignored by PL/SQL.		
Identifiers	A name, up to 30 characters in length, given to a PL/SQL object. Not sensitive		
	May include \$ (dollar sign), _ (underscore), or # (hashtag) . vCounter\$ = vcounter\$		
Lexical Units	Building blocks of any PL/SQL block and are sequences of characters including		
	letters, digits, tabs, returns, and symbols.		

Partial List of Reserved Words

ALL	CREATE	FROM	MODIFY	SELECT
ALTER	DATE	GROUP	NOT	SYNONYM
AND	DEFAULT	HAVING	NULL	SYSDATE
ANY	DELETE	IN	NUMBER	TABLE
AS	DESC	INDEX	OR	THEN
ASC	DISTINCT	INSERT	ORDER	UPDATE
BETWEEN	DROP	INTEGER	RENAME	VALUES
CHAR	ELSE	INTO	ROW	VARCHAR2
COLUMN	EXISTS	IS	ROWID	VIEW
COMMENT	FOR	LIKE	ROWNUM	WHERE

PL SQL 1/2 Página **7** de **24**

Delimiters

Symbol	Meaning	Symbol	Meaning
+	addition operator	<>	inequality operator
-	subtraction/negation operator	!=	inequality operator
*	multiplication operator	- 11	concatenation operator
/	division operator		single-line comment indicator
=	equality operator	/*	beginning comment delimiter
1	character string delimiter	*/	ending comment delimiter
;	statement terminator	**	exponent
		:=	assignment operator

2-3 Recognizing Data Types

Object	A schema object with a name, attributes, and methods.			
Scalar	Hold a single value with no internal components.			
Composite	Contain internal elements that are either scalar (record) or composite (record and table)			
Reference	Hold values, called pointers, that point to a storage location.			
LOB	Hold values, called locators, that specify the location of large objects (such as graphic			
	images) that are stored out of line. (text, images, video, audio) up to 4GB			
BFILE	Store large binary files outside of the database.			
BLOB	Store large unstructured or structured binary objects.			
CLOB	Store large blocks of character data in the database.			
NCLOB	Store large blocks of single-byte or fixed width multi-byte NCHAR data in the database.			
	National language character large object (NCLOB)			

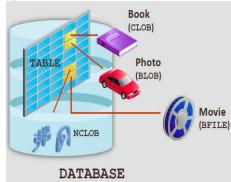

PL/SQL supports five categories of data type

Data Type	Description		
Scalar	Holds a single value with no internal elements.		
	Character (char [132767], varchar2, long(2GB)		
	Number(number, pls_integer)		
	Date(date, Timestamp)		
	Boolean (True, False, Null)		
Composite	Contains multiple internal elements that can be manipulated		
	individually. Record(One row), Table, Varray		
	RECORD v_emp_record employees%ROWTYPE;		
	v_emp_record.first_name		
Large Object	Holds values called locators that specify the location of large		
(LOB)	objects (such as graphic images) that are stored out of line.		
Reference	Holds values called pointers that point to a storage location.		
Object	It is a schema object with a name, attributes, and methods.		
	An object data type is similar to the class mechanism		
	supported by C++ and Java.		

LOB Data Type

CLOB, BLOB, and NCLOB data is stored in the database, either inside or outside of the row.

BFILE data is stored in operating system files outside the database.

PL SQL 1/2 Página **8** de **24**

2-4 Using Scalar Data Types

BOOLEAN	A datatype that stores one of the three possible values used for logical calculations: TRUE, FALSE, or NULL.
%TYPE	Attribute used to declare a variable according to another previously declared variable or database column. PL/SQL determines the data type and size of the variable.

Identifier table_name.column_name%TYPE; Identifier identifier%TYPE;

```
set SERVEROUTPUT ON
DECLARE
   v valid
               BOOLEAN := True;
   v id
                employees.employee id%TYPE default 100;
   v_last_name VARCHAR2(25);
                employees.salary%TYPE;
   v salary
   v_new_salary v_salary%TYPE;
BEGIN
    select last name, salary into v last name, v salary
    from employees where employee id = v id;
    IF v valid THEN
        DBMS OUTPUT.PUT LINE(v Last name || ' ' || (v salary+1));
       DBMS OUTPUT.PUT LINE('Test is FALSE');
   END IF;
END;
```

2-5 Writing PL/SQL Executable Statements

Explicit conversion Converts values from one data type to another by using built-in function	
Implicit conversion	Converts data types dynamically if they are mixed in a statement.

Character Functions:			Number	Functions:		Date Functions:	
ASCII	LENGTH	RPAD	ABS	EXP	ROUND	ADD_MONTHS	MONTHS_BETWEEN
CHR	LOWER	RTRIM	ACOS	LN	SIGN	CURRENT_DATE	ROUND
CONCAT	LPAD	SUBSTR	ASIN	LOG	SIN	CURRENT TIMESTAMP	SYSDATE
INITCAP	LTRIM	TRIM	ATAN	MOD	TAN	_	
INSTR	REPLACE	UPPER	COS	POWER	TRUNC	LAST_DAY	TRUNC

Implicit Conversions (It's not recommended)	Explicit Conversions	
	TO_NUMBER()	ROWIDTONCHAR()
	TO_CHAR()	HEXTORAW()
	TO_CLOB()	RAWTOHEX()
	CHARTOROWID()	RAWTONHEX()
	ROWIDTOCHAR()	TO_DATE()

PL SQL 1/2 Página **9** de **24**

Operator	Operation
**	Exponentiation
+, -	Identity, negation
*,/	Multiplication, division
+, -,	Addition, subtraction, concatenation
=, <, >, <=, >=, <>, !=, ~=, ^=, IS NULL, LIKE, BETWEEN, IN	Comparison
NOT	Logical negation
AND	Conjunction
OR	Inclusion

Statements can continue over several lines:	DECLARE
v_quote := 'The only thing that we can know is that we know	x VARCHAR2(20);
nothing and that is the highest flight of human reason.';	BEGIN
	x := '123' + '456' ;
Numbers can be simple values or scientific notation: v_salary number := 2E4;	DBMS_OUTPUT.PUT_LINE(x);
v_good_sal := v_sal BETWEEN 5000 AND 15000;	END;

2-6 Nested Blocks and Variable Scope

Block label	A name given to a block of code which allows access to the variables that have scope, but are not visible.			
Variable scope	Consists of all the blocks in which the variable is either local (the declaring block) or			
	global (nested blocks within the declaring block).			
Variable visibility The portion of the program where the variable can be accessed without using				
	qualifier.			

```
<<outer>>
                                                    DECLARE
<<outer>>
                                                      v_father_name VARCHAR2(20):='Patrick';
optional Label with
                                                      v_date_of_birth DATE:='20-Apr-1972';
                                                    BEGIN
any name
                                                      DECLARE
                                                        v_child_name VARCHAR2(20):='Mike';
                                                        v_date_of_birth DATE:='12-Dec-2002';
                                                      BEGIN
                                                        DBMS_OUTPUT.PUT_LINE('Father''s Name: '||v_father_name);
                                                        DBMS_OUTPUT.PUT_LINE('Date of Birth: ' ||outer.v_date_of_birth);
                                                        DBMS_OUTPUT.PUT_LINE('Child''s Name: ' ||v_child_name);
DBMS_OUTPUT.PUT_LINE('Date of Birth: ' ||v_date_of_birth);
DECLARE
  v_outer_var VARCHAR2(20):='GLOBAL';
BEGIN
                                                      DBMS_OUTPUT.PUT_LINE('');
                                                      DBMS_OUTPUT.PUT_LINE('Date of Birth: ' || v_date_of_birth);
  DECLARE
     v inner var VARCHAR2(20):='LOCAL';
  BEGIN
     DBMS_OUTPUT.PUT_LINE(v_inner_var);
     DBMS_OUTPUT.PUT_LINE(v_outer_var);
  END;
  DBMS_OUTPUT.PUT_LINE(v_outer_var);
END;
```

PL SQL 1/2 Página **10** de **24**

2-7 Good Programming Practices

Category	Case Convention	Examples
SQL keywords	Uppercase	SELECT, INSERT
PL/SQL keywords	Uppercase	DECLARE, BEGIN, IF
Data types	Uppercase	VARCHAR2, BOOLEAN
Identifiers (variables, etc.)	Lowercase	v_salary, emp_cursor, c_tax_rate, p_empno
Tables and columns	Lowercase	employees, dept_id, salary, hire_date

Variables starting with v_ indent each level of code use %TYPE

Constants starting with c_

Parameters starting with p_

PL SQL 1/2 Página **11** de **24**

Section 3 – Using SQL in PL/SQL

3-1 Review of SQL DML

DELETE	Statement used to remove existing rows in a table.		
INSERT	Statement used to add new rows to a table.		
MERGE	Statement used to INSERT and/or UPDATE a target table, based on matching values in a		
	source table. UPSERT		
UPDATE	Statement used to modify existing rows in a table.		
DDL	When you create, change, or delete an object in a database.		
DML	When you change data in an object (for example, by inserting or deleting rows).		

	DELETE FROM employees WHERE department	ent_id= 80;	If the WHERE clause is omitted, ALL rows will be deleted
ſ	DATE employees If the WHERE of		clause is omitted, ALL rows will be modified.

UPDATE employees	If the WHERE clause is omitted, ALL rows will be modified.
SET salary = 11000, commission_pct= .3	
WHERE employee_id= 176;	

1	2
CREATE TABLE bonuses (INSERT INTO bonuses(employee_id)
employee_id NUMBER(6,0) NOT NULL,	SELECT employee_id FROM employees
bonus NUMBER(8,2) DEFAULT 0);	WHERE salary < 10000;
3	
MERGE INTO bonuses b	
USING employees e	
ON (b.employee_id= e.employee_id)	
WHEN MATCHED THEN	
UPDATE SET b.bonus= e.salary * .05;	
WHEN not MATCHED THEN	
INSERT VALUES(e.employee_id, e.bonus);	

PL SQL 1/2 Página **12** de **24**

3-2 Retrieving Data in PL/SQL

You cannot use DDL and DCL directly in PL/SQL, except to use Dynamic SQL "Execute Immediate" statement.

Handle Style	Description
DDL	CREATE TABLE, ALTER TABLE, DROP TABLE
DCL	GRANT, REVOKE

```
set SERVEROUTPUT ON
SELECT select_list
INTO {variable_name [, variable_name]...
                                           DECLARE
    | record_name}
                                             v_id employees.employee_id%TYPE:= 100;
FROM table
                                             r_emp employees%ROWTYPE;
[WHERE condition];
                                           BEGIN
                                             SELECT * INTO r_emp
                                             FROM employees
                                             WHERE employee_id = v_id;
                                                                                      -- whithout where
                                             if SQL%FOUND THEN
                                                DBMS_OUTPUT.PUT_LINE(r_emp.last_name||' '||r_emp.salary);
                                             End if;
                                           END;
```

3-3 Manipulating Data in PL/SQL

Implicit cursors	Defined automatically by Oracle for all SQL data manipulation statements, and for queries that return only one row. An implicit cursor is always automatically named "SQL"
Explicit cursors	Defined by the programmer for queries that return more than one row.
MERGE	Statement <u>selects</u> rows from one table to update and/or insert into another table. The decision whether to update or insert into the target table is based on a condition in the ON clause.
INSERT	Statement adds new rows to the table.
DELETE	Statement removes rows from the table.
UPDATE	Statement modifies existing rows in the table.

Cursor Attributes for Implicit Cursors

Attribute	Description
SQL%FOUND	Boolean attribute that evaluates to TRUE if the most recent SQL statement returned
	at least one row.
SQL%NOTFOUND	Boolean attribute that evaluates to TRUE if the most recent SQL statement did not
	return even one row.
SQL%ROWCOUNT	An integer value that represents the number of rows affected by the most recent SQL
	statement.

PL SQL 1/2 Página **13** de **24**

```
set SERVEROUTPUT ON

DECLARE

v_sal_increase employees.salary%TYPE:= 800;

BEGIN

UPDATE copy_emp

SET salary = salary + v_sal_increase

WHERE job_id = 'ST_CLERK';

DBMS_OUTPUT.PUT_LINE(SQL%ROWCOUNT || ' rows updated.');

END;
```

3-4 Using Transaction Control Statements

Transaction	An inseparable list of database operations, which must be executed either in its entirety or not at all.
ROLLBACK	Used for discarding any changes that were made to the database after the last COMMIT.
SAVEPOINT	Used to mark an intermediate point in transaction processing.
COMMIT	Statement used to make database changes permanent.
END	Keyword used to signal the end of a PL/SQL block, not the end of a transaction.

```
BEGIN
INSERT INTO pairtable VALUES (1, 2);
COMMIT;
END;

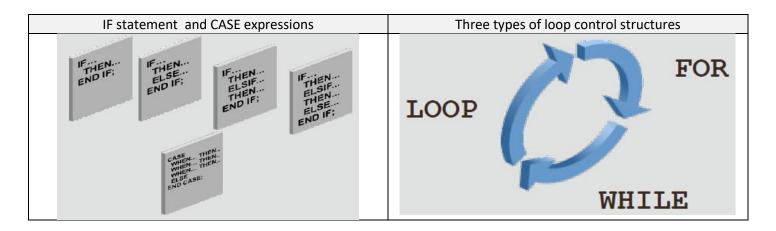

BEGIN
INSERT INTO pairtable VALUES (7, 8);
SAVEPOINT my_sp_1;
INSERT INTO pairtable VALUES (9, 10);
SAVEPOINT my_sp_2;
INSERT INTO pairtable VALUES (11, 12);
ROLLBACK to my_sp_1;
INSERT INTO pairtable VALUES (13, 14);
COMMIT;
END;
```

PL SQL 1/2 Página **14** de **24**

Section 4 – Program Structures to Control Execution Flow

4-1 Conditional Control: IF Statements

IF	Statement that enables PL/SQL to perform actions selectively based on conditions.	
LOOP	Control structures – Repetition statements that enable you to execute statements in a	
	PL/SQL block repeatedly.	
Condition	An expression with a TRUE or FALSE value that is used to make a decision.	
CASE	An expression that determines a course of action based on conditions and can be used	
	outside a PL/SQL block in a SQL statement.	

```
IF condition THEN
                            set SERVEROUTPUT ON
    statements:
                            DECLARE
[ELSIF condition THEN
                                v_myage NUMBER := 10;
                            BEGIN
    statements;]
[ELSE
                                IF v_myage > 0 AND v_myage< 11 THEN</pre>
                                    DBMS_OUTPUT.PUT_LINE('I am a child');
    statements;]
END IF;
                                ELSIF v myage< 20 THEN
                                    DBMS_OUTPUT.PUT_LINE('I am young');
                                ELSIF v_myage< 30 THEN
                                    DBMS_OUTPUT.PUT_LINE('I am in my twenties');
                                ELSIF v_myage< 40 THEN
                                    DBMS_OUTPUT.PUT_LINE('I am in my thirties');
                                ELSE
                                    DBMS_OUTPUT.PUT_LINE('I am mature');
                                END IF;
                            END;
```

PL SQL 1/2 Página **15** de **24**

4-2 Conditional Control: Case Statements

Logic Tables	Shows the results of all possible combinations of two conditions.
CASE statement	A block of code that performs actions based on conditional tests.
CASE expression	An expression that selects a result and returns it into a variable.

Logic Tables													
AND	TRUE	FALSE	NULL			OR	TRUE	FALSE	NULL		NOT		
TRUE	TRUE	Ex. FALSE	NULL			TRUE	TRUE	TRUE	TRUE		TRUE	FALSE	
FALSE	FALSE	FALSE	FALSE			FALSE	TRUE	FALSE	NULL		FALSE	TRUE	
NULL	NULL	FALSE	NULL			NULL	TRUE	NULL	NULL		NULL	NULL	

```
CASE Statements
DECLARE
                                           DECLARE
  v_age NUMBER := 10;
                                                v_age NUMBER := 10;
  v txt varchar2(50);
                                               v txt varchar2(50);
BEGIN
                                           BEGIN
 CASE v_age

4-3 Iterative Control: Basic Loops

Basic Loop	Encloses a sequence of statements between the keywords LOOP and END LOOP and
	must execute at least once.
EXIT	Statement to terminate a loop.

```
Without the EXIT statement,
                            the loop would never end (an infinite loop)
BEGIN
                             DECLARE
                                                                     DECLARE
  LOOP
                               v_counter NUMBER(2) := 1;
                                                                       v_counter NUMBER := 1;
                             BEGIN
                                                                     BEGIN
    statements;
    EXIT [WHEN condition];
                               LOOP
                                                                       LOOP
                                                                         DBMS_OUTPUT.PUT_LINE(v_counter);
  END LOOP;
                                 DBMS_OUTPUT.PUT_LINE(v_counter);
END;
                                 v_counter := v_counter + 1;
                                                                         v_counter := v_counter + 1;
                                 EXIT WHEN v_counter > 5;
                                                                         IF v_counter > 5 THEN EXIT;
                               END LOOP;
                                                                         END IF;
                             END;
                                                                       END LOOP;
                                                                     END;
```

4-4 Iterative Control: While and For Loops

WHILE Loop	Repeats a sequence of statements until the controlling condition is no longer TRUE.
FOR Loop	Repeats a sequence of statements until a set number of iterations have been
	completed.

WHILE condition LOOP	FOR counter IN [REVERSE] lowerupper LOOP
statement1;	statement1;
statement2;	statement2;
END LOOP;	END LOOP;
DECLARE	DECLARE
v_counter NUMBER(2) := 1;	v_limit NUMBER(2) := 5;
BEGIN	BEGIN
WHILE v_counter < 5 LOOP	FOR i IN 1v_limit LOOP
DBMS_OUTPUT.PUT_LINE(v_counter);	DBMS_OUTPUT.PUT_LINE(i);
v_counter := v_counter + 1;	END LOOP;
END LOOP;	END;
END;	

PL SQL 1/2 Página **17** de **24**

4-5 Iterative Control: Nested Loops

```
Declare
                                           DECLARE

Section 5 – Using Cursors and Parameters

5-1 Introduction to Explicit Cursors

Implicit Cursor	Defined automatically by Oracle for all SQL DML statements, and for SELECT statements that return only one row
	, and the second
Explicit Cursor	Declared by the programmer for queries that return more than one row
Cursor	A label for a context area or a pointer to the context area
Context Area	An allocated memory area used to store the data processed by a SQL statement
Active set	The set of rows returned by a multiple row query in an explicit cursor operation
OPEN	Statement that executes the query associated with the cursor, identifies the active
	set, and positions the cursor pointer to the first row
FETCH	Statement that retrieves the current row and advances the cursor to the next row
	either until there are no more rows or until a specified condition is met
CLOSE	Disables a cursor, releases the context area, and undefines the active set

```
DECLARE
CURSOR cur_depts IS
   SELECT department_id, department_name
   FROM departments;
BEGIN
   FOR c_dep in cur_depts LOOP
       DBMS_OUTPUT.PUT_LINE(c_dep.department_id||' '||c_dep.department_name);
   END LOOP;
END;
```

PL SQL 1/2 Página **19** de **24**

```
DECLARE

CURSOR cur_depts IS

SELECT department_id, department_name FROM departments;

v_department_id departments.department_id%TYPE;

v_department_name departments.department_name%TYPE;

BEGIN

OPEN cur_depts;

LOOP

FETCH cur_depts INTO v_department_id, v_department_name; -- 2 variables

EXIT WHEN cur_depts%NOTFOUND;

DBMS_OUTPUT_PUT_LINE(v_department_id||''||v_department_name);

END LOOP;

CLOSE cur_depts;

END;
```

```
DECLARE

CURSOR cur_depts_emps IS

SELECT department_name, COUNT(*) AS how_many

FROM departments d, employees e

WHERE d.department_id = e.department_id

GROUP BY d.department_name

HAVING COUNT(*) > 1;
...
```

5-2 Using Explicit Cursor Attributes

Attribute	Туре	Description
Record		A composite data type in PL/SQL, consisting of a number of fields each with their own name and data type
%ROWTYPE		Declares a record with the same fields as the cursor on which it is based
%ISOPEN	Boolean	Evaluates to TRUE if the cursor is open.
%NOTFOUND	Boolean	Evaluates to TRUE if the most recent fetch did not return a row.
%FOUND	Boolean	Evaluates to TRUE if the most recent fetch returned a row; opposite of %NOTFOUND.
%ROWCOUNT	Number	Evaluates to the total number of rows FETCHed so far.

```
set SERVEROUTPUT ON
                                              DECLARE
DECLARE
                                                  CURSOR cur_emps_dept IS
                                                       SELECT last_name, department_name
    CURSOR cur_emps IS
        SELECT *FROM employees
                                                       FROM employees e, departments d
        WHERE department id= 60;
                                                      WHERE e.department id=d.department id;
    r_emp cur_emps%ROWTYPE;
                                                  r_emp_dep cur_emps_dept%ROWTYPE;

call pr_Emp(90);
```

5-5 Using Cursors For Update

FOR UPDATE	Declares that each row is locked as it is being fetched so other users cannot modify	
	the rows while the cursor is open	
NOWAIT	A keyword used to tell the Oracle server not to wait if the requested rows have	
	already been locked by another user	

```
CURSOR cursor_name IS
SELECT... FROM...
FOR UPDATE [OF column_reference] [NOWAIT | WAIT n];
```

n = number of seconds to wait and check whether the rows are unlocked.

If the cursor is based on a join of two tables, we may want to lock the rows of one table but not the other To do this, we specify **any column** of the table we want to lock.

It also allows us to modify the rows ourselves using a ... WHERE CURRENT OF cursor-name

```
DECLARE

CURSOR cur_eds IS

SELECT employee_id, salary, department_name

FROM my_employees e, my_departments d

WHERE e.department_id = d.department_id

FOR UPDATE OF salary NOWAIT;

BEGIN

FOR r_eds IN cur_eds LOOP

UPDATE my_employees

SET salary = r_eds.salary * 1.1

WHERE CURRENT OF cur_eds;

END LOOP;

END;
```

PL SQL 1/2 Página **22** de **24**

5-6 Using Multiple Cursors

Explain the need for using multiple cursors to produce multi-level reports

```
set SERVEROUTPUT ON
DECLARE
   CURSOR cur_dep IS
     SELECT * FROM departments;
   CURSOR cur_emp (p_dep NUMBER) IS
     SELECT * FROM employees WHERE department_id = p_dep;
BEGIN
   FOR r_dep IN cur_dep LOOP
   DBMS_OUTPUT.PUT_LINE(upper(r_dep.department_name));
   FOR r_emp IN cur_emp (r_dep.department_id) LOOP
     DBMS_OUTPUT.PUT_LINE(r_emp.last_name);
   END LOOP;
   DBMS_OUTPUT.PUT_LINE('');
   END LOOP;
END LOOP;
END;
```
